

Robocon- Tinkercad Task-3.3

Circuit diagram and code explanation

Task- Make your own map function instead of using the inbuilt function which returns a float and implement it in code

Circuit:

Explanation:

Components used—Arduino UNO, potentiometer, jumper wires

Code logic—

- We create a new float function with 5 parameters
- The return of that function contains the formula for conversion of value
- In the loop we use our self defined function to convert the value
- We print the input and converted output value through Serial.print
